

Programming Fundamentals – Lab Session 06

Question 01)

First way

```
#initialization
count = 1
#variables
total = 0
avg = 0

while count <= 5:
    mark = float(input("Enter the mark: "))
    total = total+mark
    count = count+1
avg = total/5

print("Tatal" ,total)
print("Average" ,avg)

if avg >= 50:
    print("Pass")
else:
    print("Fail")
```

With Count and Range

```
total = 0
for count in range (1,6):
    mark = (float("Enter mark: "))
    total = total + mark
avg = total/5

print("Tatal" ,total)
print("Average" ,avg)

if avg >= 50:
    print("Pass")
else:
    print("Fail")
```

Question 02)

```
while True:
    pin = input("Enter the pin: ")

    if pin == "1234":
        print("Access Granted")
        break
    else:
        print("Try Again")
```

Question 03)

```
total = 0

for i in range (1,6):
    price =float(input("Enter the price: "))
    total = total + price

if total > 5000:
    discount = total * 0.20
else:
    discount = 0

final = total - discount

print(total)
print(discount)
print(final)
```

Question 05)

```
total = 0

while True:
    amount = float(input("enter deposit value or 0 to stop"))
    if amount ==0:
        break
    total = total + amount

print("Total :", total)

if total >=10000:
    print("Premium Customer")
else:
    print("Regular Customer")
```

Question 10)

```
count = 0
while count <=4:
    sales=float(input("Enter the sales value; "))
    if sales >=5000:
        com=sales*0.10
        print("Commision; ", com)
    else:
        print("No Commision")
```
